with relatively long alkyl chains (up to C11) was investigated in order to obtain a correlation between the melting and crystallization temperature and the chain length. A series of poly(3-hexylthiophene) (P3HT) films with long alkyl chains were prepared by directly growing them on the flat surfaces of amorphous silicon/silicon dioxide substrates by the thermally activated depolymerization of the corresponding precursor films. The resulting polymers have a

high degree of disorder with the alkyl chains being sufficiently separated from each other, which is characterized by high diffraction patterns and the presence of only a broad second-order transition in the differential scanning calorimetry (DSC) thermograms. The packing of these long alkyl chains in the polymer matrix can be tuned by simply selecting the polymerization temperature. The melting temperatures of the corresponding film increase with

the alkyl chain length, while the crystallization temperature decreases with increasing chain length. The difference in the thermal properties of the solid polymers with long alkyl chains compared to the corresponding monomer was found to be greater than 1 J/g. This observed thermal difference is explained by the increase of the stiffness of the polymer matrix due to the longer alkyl chains. This increase of the stiffness of the polymer matrix facilitates the thermal dissociation

and slow relaxation of the alkyl chains of the solid polymer, thus lowering the melting temperature. The ability of the solid polymer to undergo heating and cooling cycles without any apparent change in the crystalline state of the material was established by scanning electron microscopy and X-ray diffraction. Based on these results and using the internal heat gain from Joule-Thomson refrigeration of the gas, different heat-transfer systems of MIST (Molecular, Ion, Solid,

Thermochromic) materials were designed and synthesized. The different designs resulted in different thermal responses for the cooling cycle. Our findings are relevant for future improvements of MIST materials and provide guidelines for selecting

A: If the other answers suggest that you are limited to Access, then the only option I can think of is actually copying the data from MySQL to Access, and then dumping the data back to MySQL. The problem is, depending on how much data you are talking about, this can take a considerable amount of time. If you have a lot of data, this could take days. If you have the time, I would suggest changing your

schema so that there is no need to save the data in any particular way. Having tables like 'MyTable' and 'SecondTable' isn't really useful. All the data is stored in the same table anyway, so you could just have the primary key, and add a "MyTableId" column and make this a unique, indexed id that you can use to determine which row. Or something along those lines. Wilford Brimley's Dog Hump Day has a happy ending. On Tuesday, the 75-year-old actor posted a video on Twitter showing him

giving his beloved yellow Lab, Hump, a piggyback ride before him. "He even threw in a little dance step for good measure," Brimley captioned the video with the hash tag "#HappyHumpDay." According to their pet-finder profile, Brimley and his wife, Hilda, own seven dogs and one horse. A few dog and puppy lovers were quick to share their own stories of canine love on Twitter, with "Dog Mom" Sara Luukkanen asking, "Why do we even have dogs?" "Sometimes it takes a day

like #HappyHumpDay to remind us just how much dogs love us."Q: Change ports on GRUB2 I have been trying to fix a GRUB2 issue. When I was trying to use Chrome and Steam the browser would load, but eventually stopped and gave me an error saying Steam had stopped working. Now I can't use either, and it is a problem I have had since the update. I am new to Ubuntu and don't know what 6a5afdab4c
