2D: 2D drawing support is also implemented as an Automation API, used by third-party applications in conjunction with the interface classes. These use hooks that enable the application to query the drawing and modify its state. 2D drawing features are implemented in C++ classes: 2D drawing actions can be triggered by the user with the keyboard or with the mouse. 2D drawing actions are implemented as commands that contain an operation, and one or more of the parameters that define the operation. 2D drawing can be used to manipulate a drawing by setting its properties (properties are typically represented by properties of class AutomationProperty objects). The properties can be edited by the application or by the user, and updates can be detected and handled by the application. 2D drawing support is also implemented in the following interfaces: The DrawingView interface is implemented by objects that provide a visual representation of a drawing. A View interface is a collection of drawing views for a drawing. A View is essentially an object-oriented wrapper around a collection of drawing views. The drawing document interface is implemented by objects that represent a collection of drawing documents. 2D drawing features are implemented in the AutoCAD drawing interface: 2D drawing features are implemented by methods that are invoked by the application when objects are selected, deselected, modified, added, and removed. 2D drawing is implemented by the following classes: DrawGroup contains the drawing information of one or more drawing elements that together make up a 2D drawing. Drawing elements are organized into layers and levels. Level is a hierarchy of 2D drawing objects that comprise a 2D drawing. View is a hierarchical collection of drawing views for a particular drawing element. The drawing views are organized into levels. Layer is a collection of 2D drawing elements that comprise a 2D drawing. Document is a collection of drawing documents. Drawing view is an object that represents a drawing view. Drawing element is an object that represents a 2D drawing element. A 2D drawing element can be a component, a group, a path, a text, or an image. A 2D drawing element can be selected, deselected, modified, and inserted in a layer or level. Drawing command is an object that represents a command that is executed when a drawing element is selected. Drawing extension is an object that represents an extension to the 2D drawing commands that are available in AutoCAD. Drawing element has methods for applying 2D drawing
