## Trueman's Elementary Biology Pdf Free 11

Pdf Free Download - Trueman's Elementary Biology - Learn - Free PDF. Trueman's Elementary Biology: Book 2 - Learn. This is the best biology book for class 11 and 12. It is a great book with CD. Trueman's Elementary Biology-Volume 1 For Class 11 Examination 2021-2022 | Tarun Veer Singh, IIT-Madras.Q: Performing a node addition to a linked list using Java I am creating a linked list using java and i am being able to add Node items to the linked list. I am currently having an issue when adding a Node item when the linked list size is 2 due to the java array out of bounds error. Below is my addNode method: public void addNode(int x) { Node current = head; if (head == null) { head = new Node(x); System.out.println("Head created"); return; } while (current.next != null) { current = current.next; } current.next = new Node(x); System.out.println("Added x: " + x); if (head.next == null) { System.out.println("Head added"); return; } head = head.next; } Below is an example of how I run the program. This function adds elements to the linked list and prints out each element before and after it has been added. I am using the output from the println() method to do an if statement to check if the head pointer is null or not. Is there a better way I can do this check without getting the error? A: You're not checking that head.next is null before adding current.next. Make sure you're keeping current.next null before the while loop. It should look like this: public void addNode(int x) { Node current = head; if (head == null) {
