4shared.Q: Eigenvalues of a linear differential operator
 Let L be the differential operator:

$$L := \sum_{k=0,1,\dots} \frac{\partial^{2j+k+1}}{\partial x^{2j+k+1}}$$
 I want to find all its eigenvalues, i.e. λ such that there is a solution $Lf = \lambda f$ that is, in every interval where f is continuous, there is a solution f of the above equation. I have no idea about how to proceed, since I have not yet seen a similar example. A: The question is asked in a confusing way, but it should be made clear that L is a partial differential operator of order 2 , that is, a differential operator of order 1 . To see that this is the case, let T be the operator

$$T := \sum_{j=1,2,\dots} x^{2j-1} \frac{\partial^{2j+1}}{\partial x^{2j+1}}$$
 Then $L = \frac{\partial}{\partial x} + xT$, and it should now be clear why L is a partial differential operator of order 2 . One can also show that the operator $\frac{\partial^2}{\partial x^2} + x \frac{\partial}{\partial x}$ is a partial differential operator of order 3 by showing that $\frac{\partial^3}{\partial x^3} - x \frac{\partial^2}{\partial x^2} -$

$x^2 \frac{\partial}{\partial x} = \frac{\partial}{\partial x} + xT + x^2T^2$ is in fact the infinitesimal generator of the group of smooth transformations $(x,y) \mapsto (a+bx, a+$
